

# Goal

- Understanding Disjoint Set Union ✓
- Union by Size
- Union by Rank
- Path Compression
- Applications of DSU ]
- Problem Solving ]

# Task:

Given a graph with  $n$  nodes and  $q$  queries where  $n, q \leq 10^5$ . The queries are of 2 types:

- 1. Make an edge between node  $i$  and  $j$
- 2. Given  $i$  and  $j$ , print YES if they are in the same connected component else no

#Why is this a tree structure?

→ We only add edge between un-connected components

1	2	3	4	5
---	---	---	---	---

# Naive Implementation of DSU

```
void make_set(int v) {  
    parent[v] = v;  
}
```

for( $i=1; i \leq n; i++$ )

```
int find_set(int v) {  
    if (v == parent[v])  
        return v;  
    return find_set(parent[v]);  
}
```

memoise  
root of the tree

```
void union_sets(int a, int b) {  
    → a = find_set(a);  
    → b = find_set(b);  
    * if (a != b)  
        parent[b] = a;  
}
```

a — b

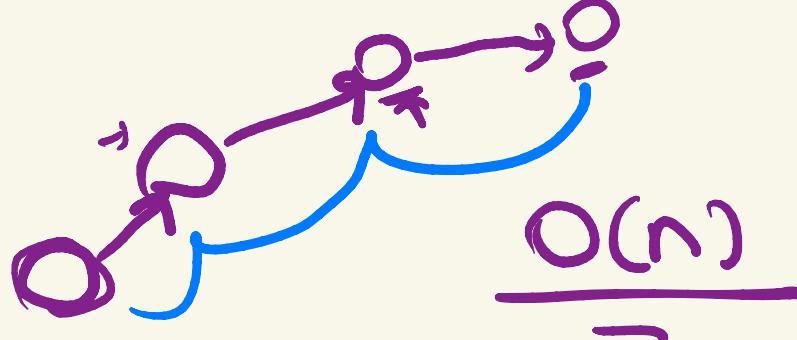

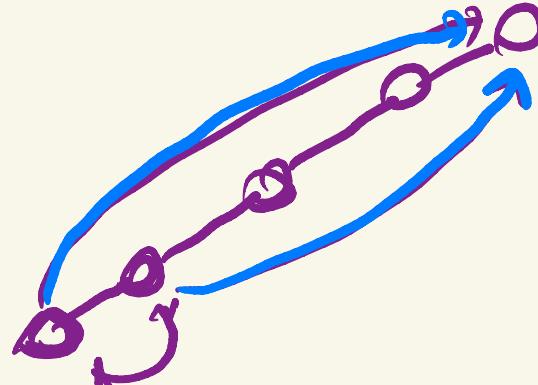

# Time complexity

Naive

~~TLE~~

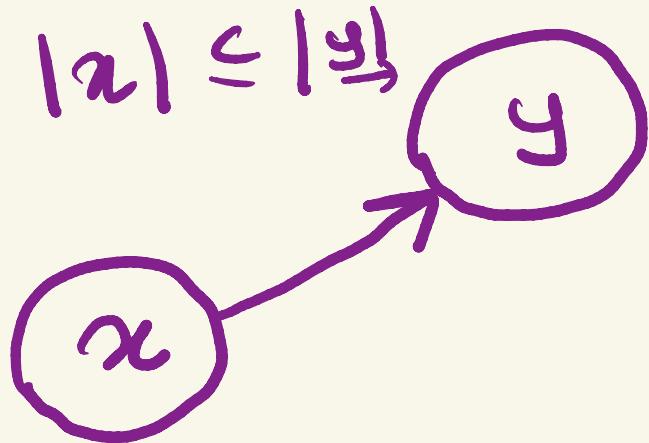

unite(a,b)  $\rightarrow O(n)$

find-set(a,b)  $\rightarrow O(n)$

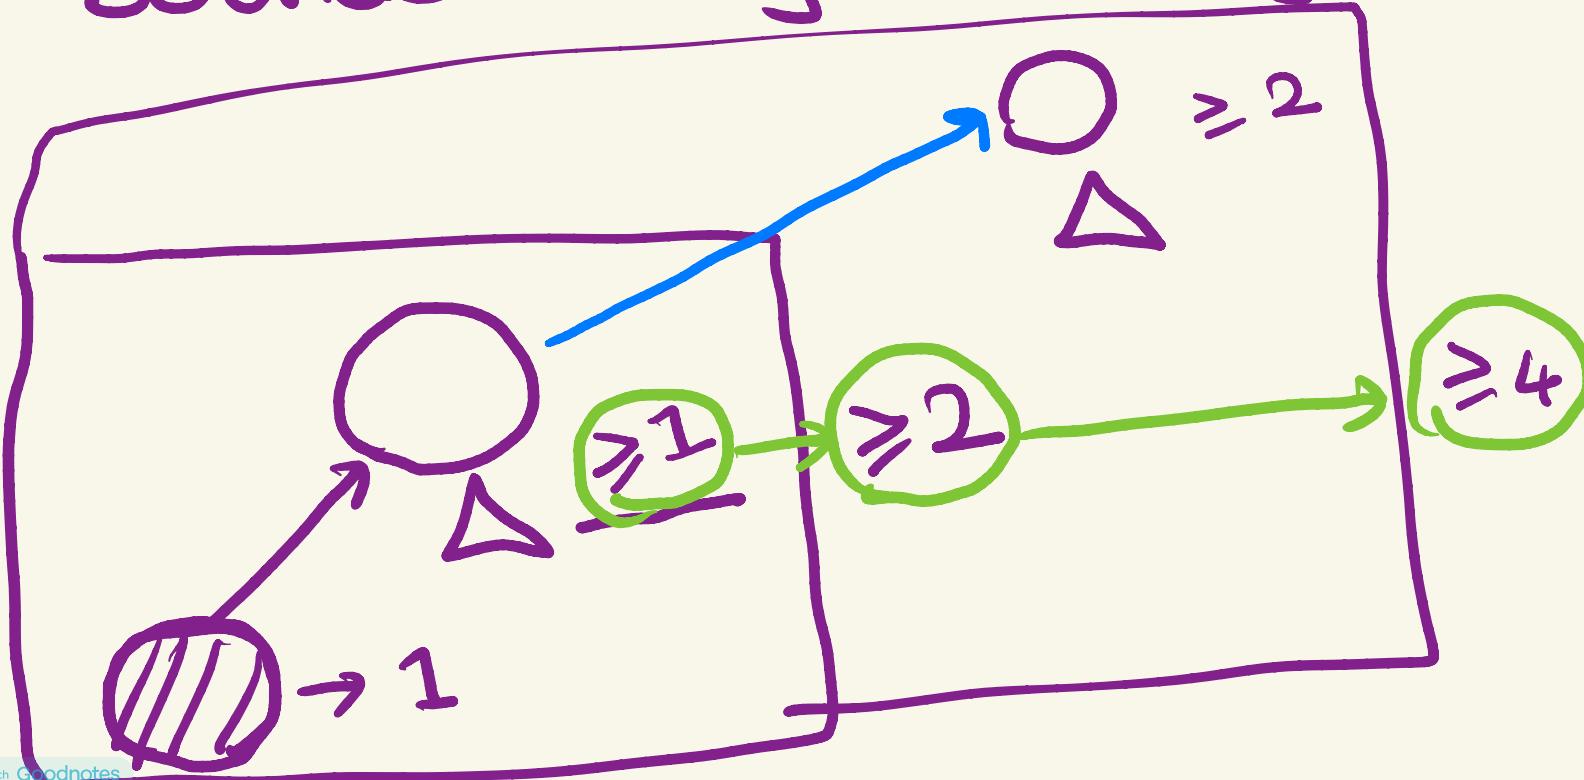

$O(n)$

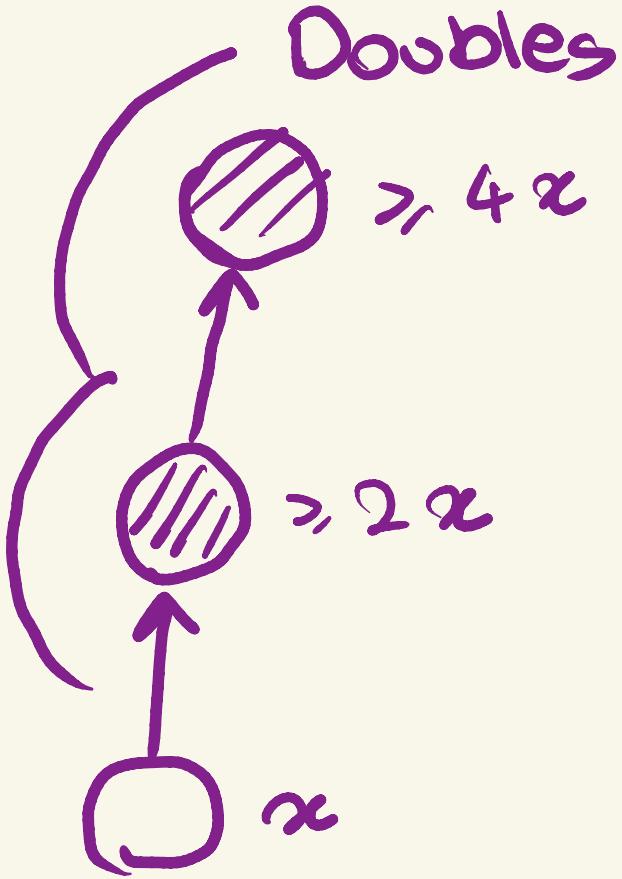

## Union by size:

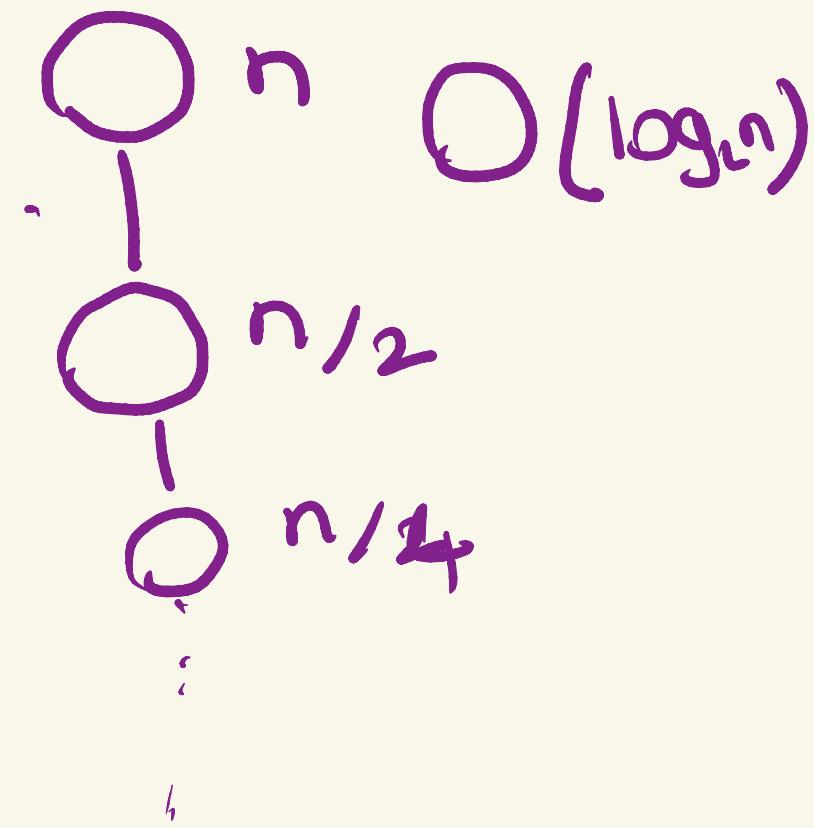

How is this helpful ??

Height of the tree is bounded by  $O(\log_2 n)$

Max height ??

# Union by Size

find-set( $x$ )

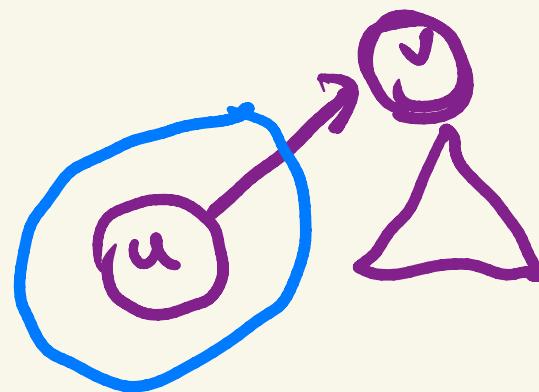

$O(\log_2 n)$

unite(a,b)

$O(\log_2)$

Size

1	1	1	1	1	1	1
---	---	---	---	---	---	---

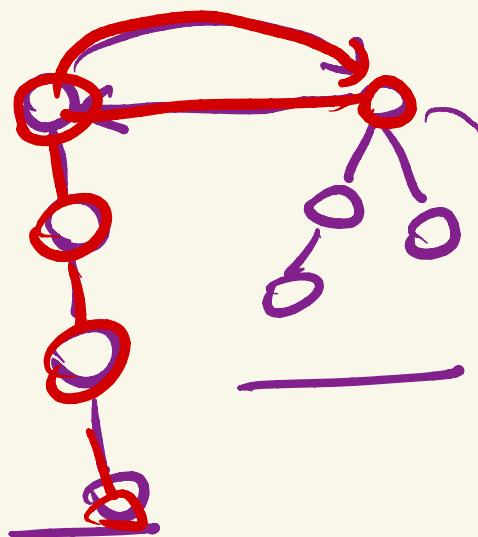

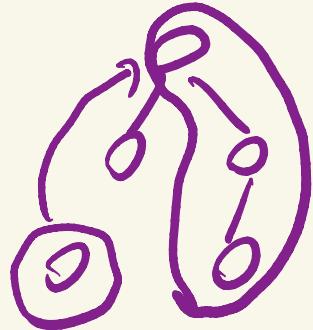

$$\frac{S_2[v] + S_2[u]}{\Theta(1)}$$

$\downarrow$  roots of components       $\downarrow$  roots of components

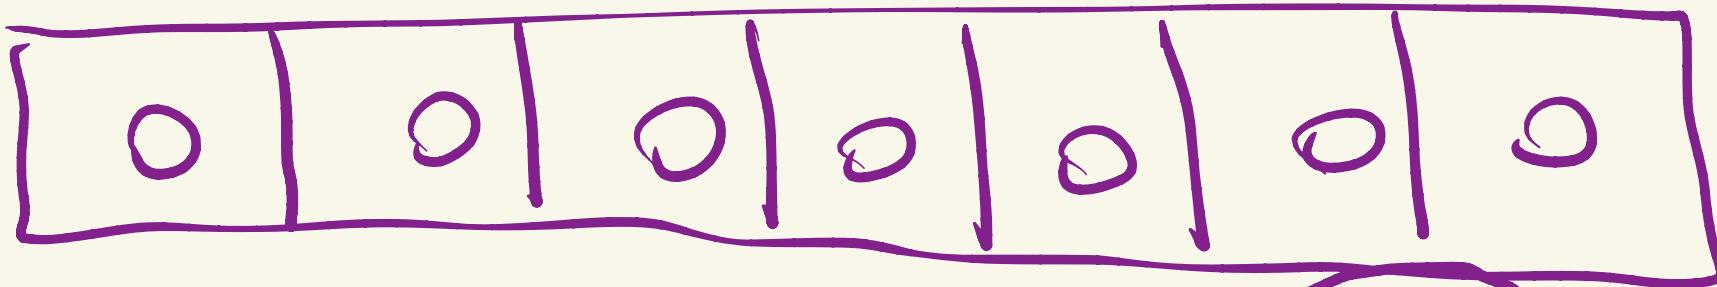

Size  $\implies$  Height . of the tree

$$S_2 = 4$$

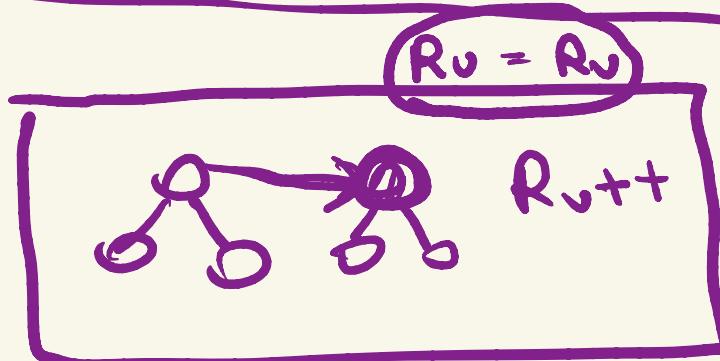

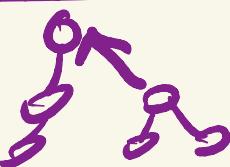

# Union by Rank

height

$R[u] > R[v]$

# Union by Size / Rank

- If we want to merge 2 components, we would like to merge the smaller component to the larger component
- This allows us to have at most  $O(\log n)$  height of our DSU Tree
- Proof:  
Consider a component of size  $x$ , it would merge into a component of size  $x$ . Now it's size is  $2x$ . This component would merge into a component of size  $2x$ . Post merging the size becomes  $4x$ .  
Basically after each merge, the size doubles. Hence  $\sim \log n$  merges

# Union by Size Implementation

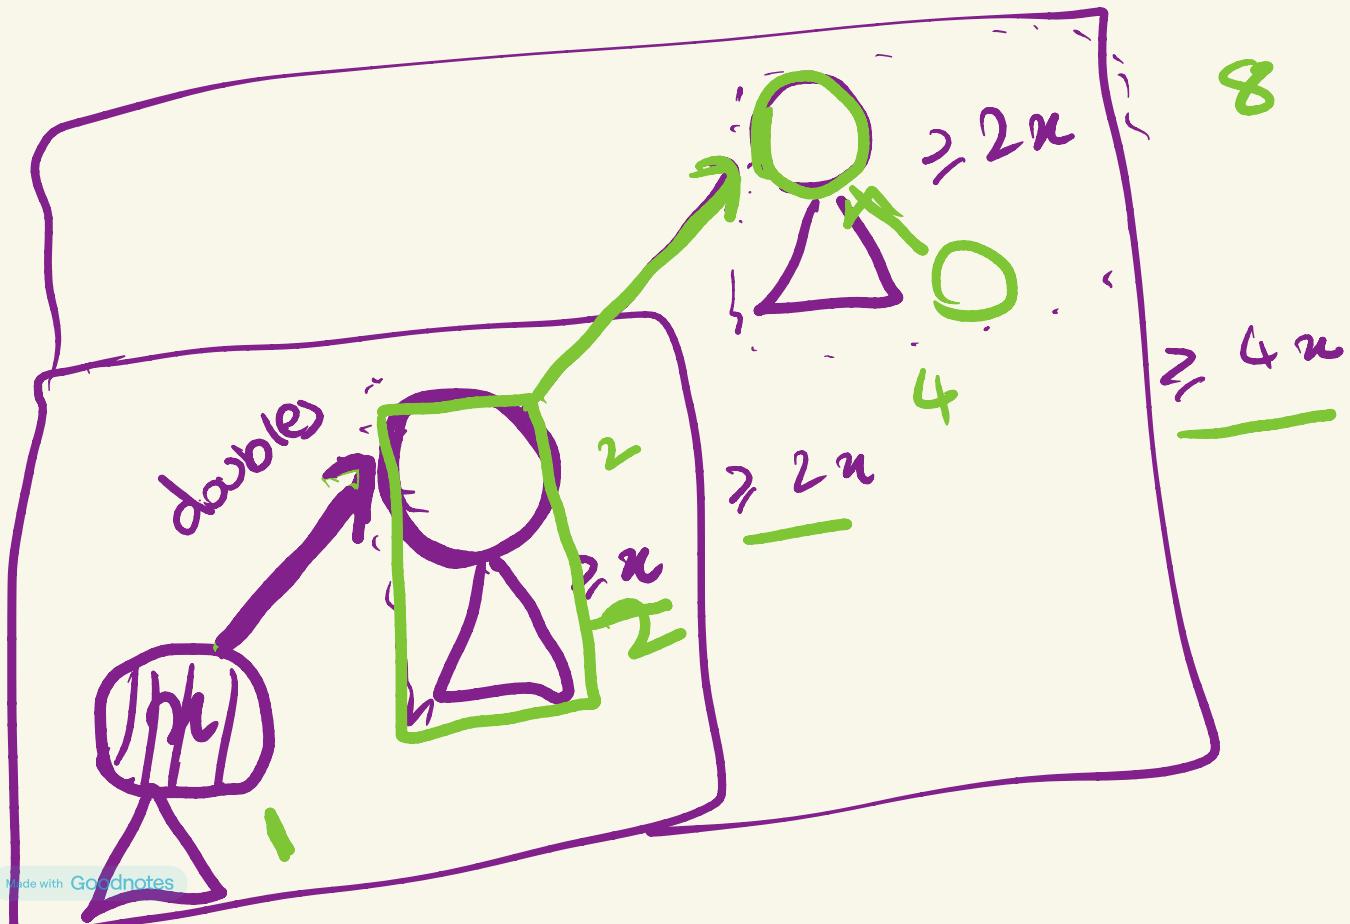

??

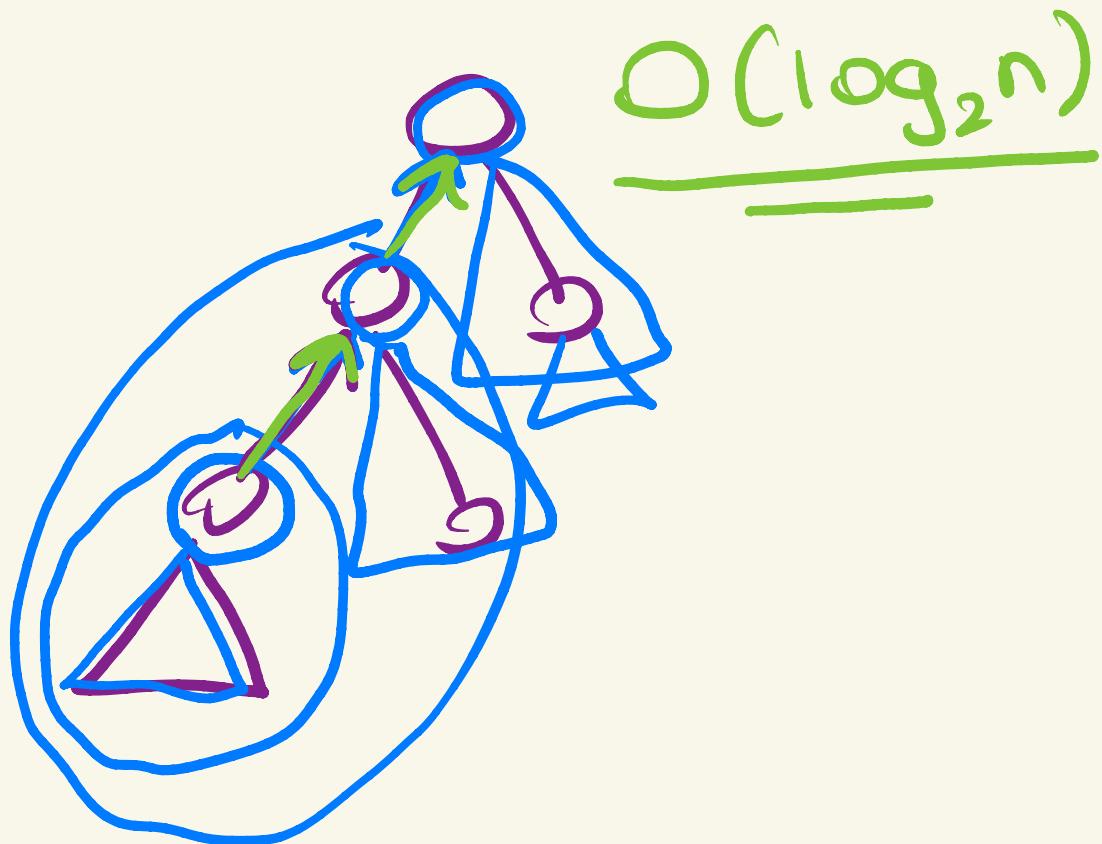

```
void make_set(int v) {
    parent[v] = v;
    size[v] = 1;
}

void union_sets(int a, int b) {
    a = find_set(a);
    b = find_set(b);
    if (a != b) {
        if (size[a] < size[b])
            swap(a, b);
        parent[b] = a;
        size[a] += size[b];
    }
}
```

$s_a \geq s_b$

16" 7

$O(\log_2 n)$

# Union by Rank Implementation

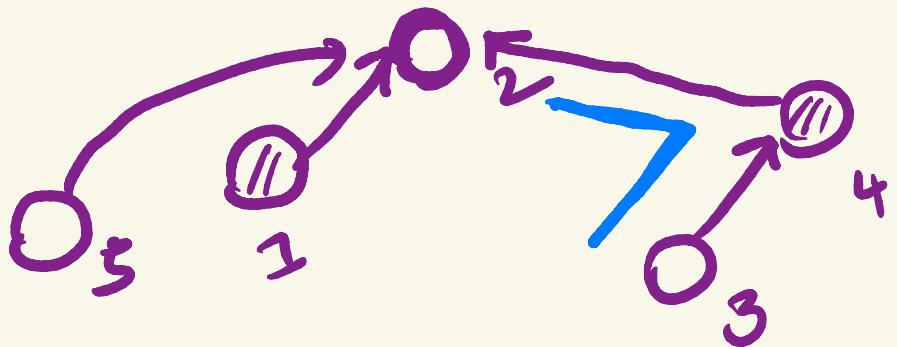

Height

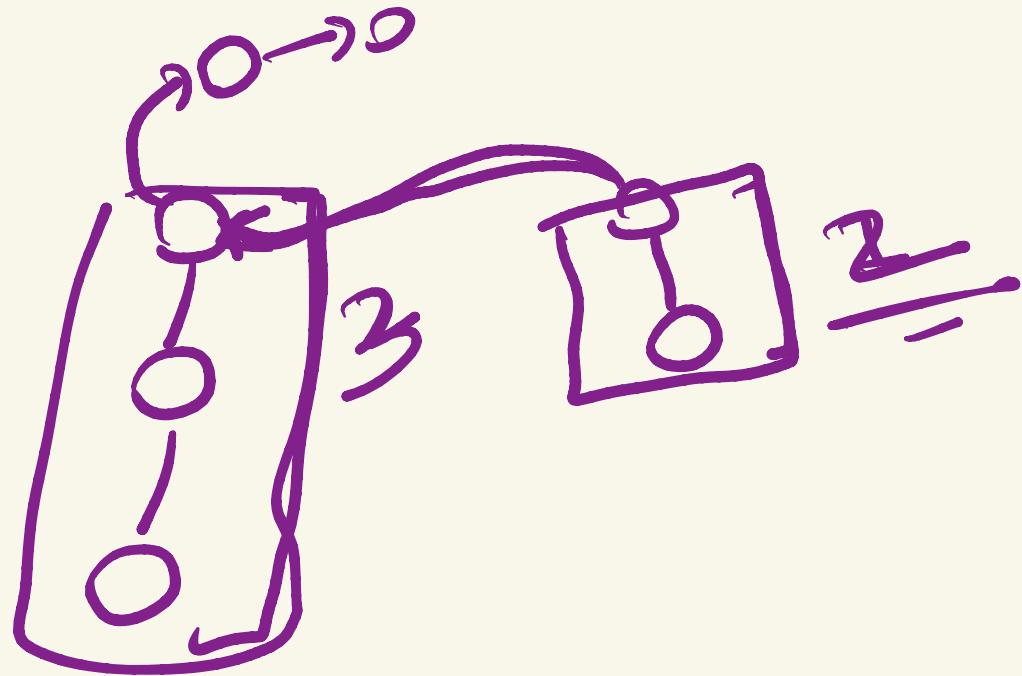

```
void make_set(int v) {
    parent[v] = v;
    rank[v] = 0; height
}

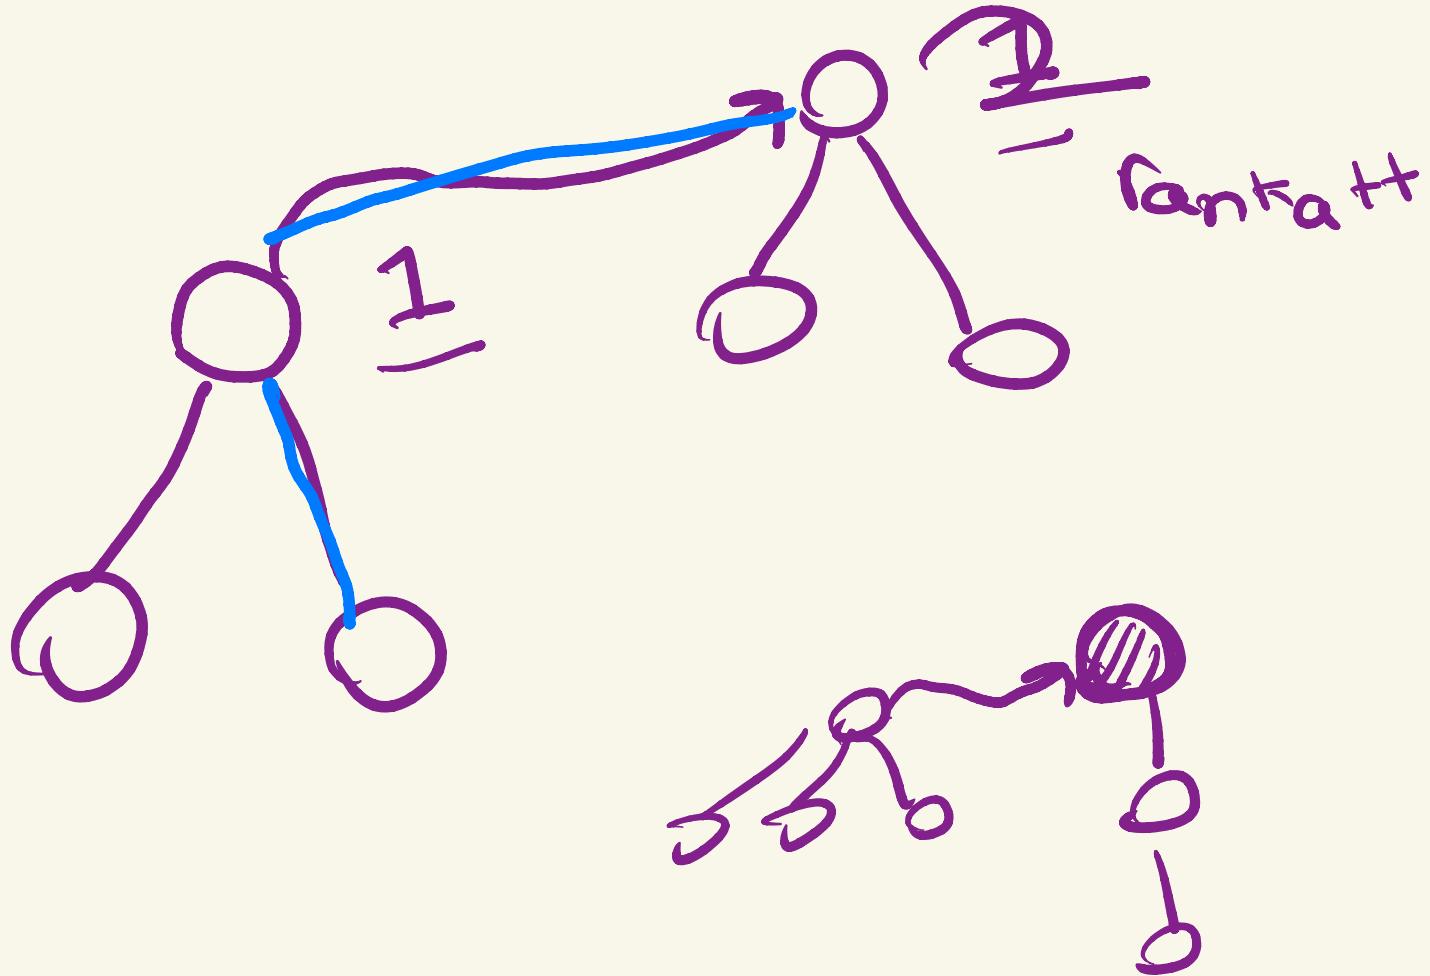

void union_sets(int a, int b) {
    a = find_set(a);
    b = find_set(b);
    if (a != b) {
        if (rank[a] < rank[b])
            swap(a, b);
        → parent[b] = a;
        if (rank[a] == rank[b])
            rank[a]++;
    }
}
```

1 2  
3 4  
4 1  
5 4

Rank	1	2	3	4	5
	0	2	0	1	0

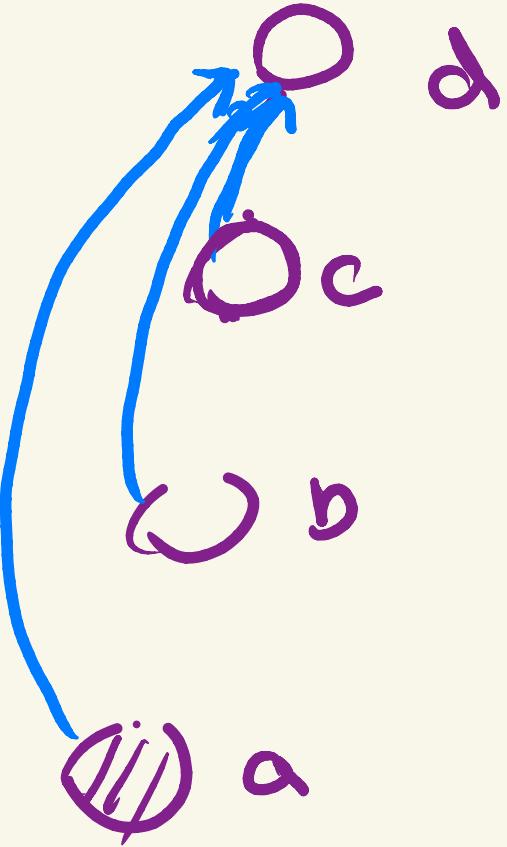

# Path Compression

- In path compression, we “memoise” the find function.
- Essentially when finding the root of a particular node  $x$ , we update the root of all parents of node  $x$  to the root.
- This alone optimises our time complexity to  $O(\log n)$  on average.
- Proof:

<http://e-maxx.ru/bookz/files/dsu/Worst-Case%20Analysis%20of%20Set%20Union%20Algorithms.%20Tarjan,%20Leeuwen.pdf>

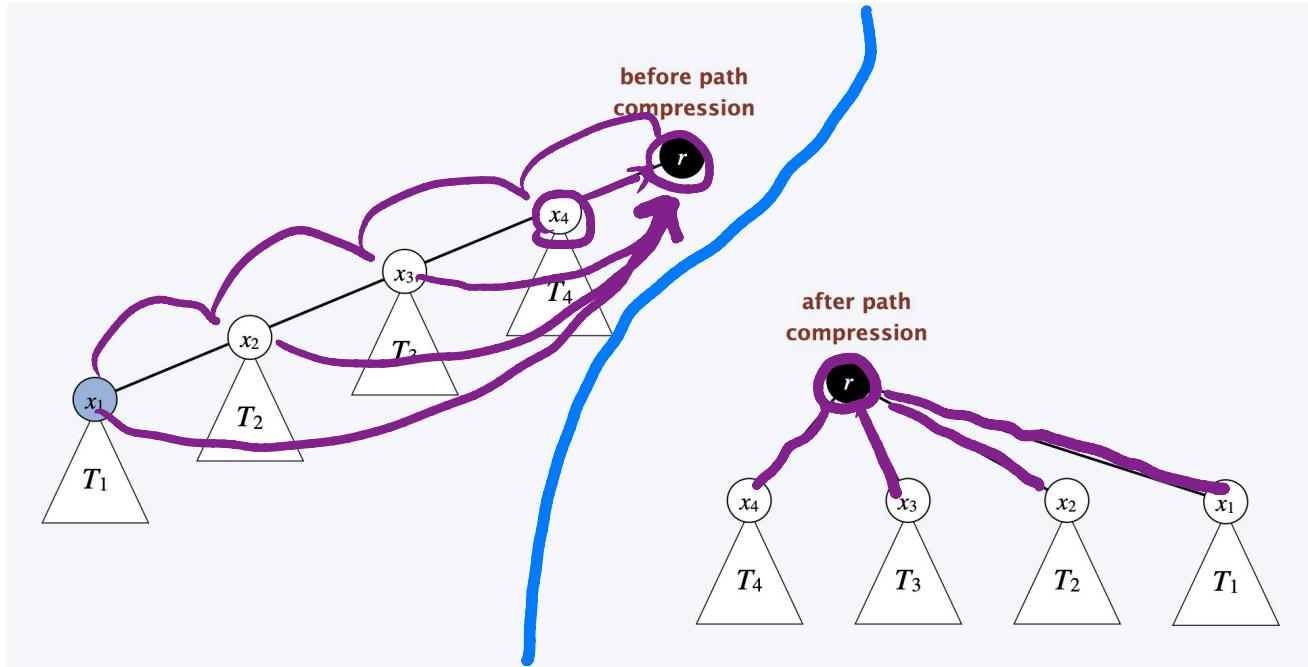

find-set( $\alpha$ ) {  
if  $p_\alpha = \alpha$  return  $\alpha$

return  $p_\alpha = \text{find-set}(p_\alpha)$

y

# Illustration of Path Compression

# Path Compression Implementation

```
int find_set(int v) {
    if (v == parent[v])
        return v;
    return parent[v] = find_set(parent[v]);
}
```

1

# Using Both Optimizations Together

- Using both optimizations together, i.e.

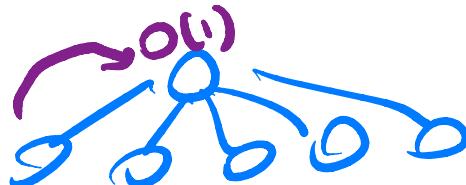

- A. Union by Rank / Size
- B. Path Compression

optimizes our time complexity to  $O(\alpha(n))$  per query

- Proof:

<https://codeforces.com/blog/entry/98275>

$\approx O(1)$  DSU  
 $O(\underline{\alpha(n)})$  avg  
↳ 4 ≈  
 $n = 10^{100}$

# Implementation of DSU (Optimized)

```
class UnionFind {
private: vector<int> p, rank;
public:
    UnionFind(int n) {
        rank.assign(n, 0); p.assign(n, 0);
        iota(p.begin(), p.end(), 0);
    }

    int findSet(int i){ return (p[i] == i) ? i : p[i] = findSet(p[i]); }

    bool isSameSet(int i, int j){ return findSet(i) == findSet(j); }

    void unionSet(int i, int j) {
        if(!isSameSet(i,j)) {
            int x = findSet(i), y = findSet(j);
            if(rank[x] > rank[y]) p[y] = x;
            else {
                p[x] = y;
                if(rank[x] == rank[y]) rank[y]++;
            }
        }
    }
};
```

any doubts!!

## D. Quantity of Strings

time limit per test: 2 seconds

memory limit per test: 256 megabytes

Just in case somebody missed it: this winter is totally cold in Nvodsk! It is so cold that one gets funny thoughts. For example, let's say there are strings with the length exactly  $n$ , based on the alphabet of size  $m$ . Any its substring with length equal to  $k$  is a palindrome. How many such strings exist? Your task is to find their quantity modulo  $1000000007 (10^9 + 7)$ . Be careful and don't miss a string or two!

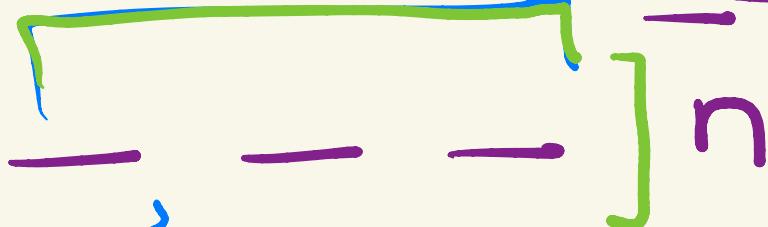

Let us remind you that a string is a palindrome if it can be read the same way in either direction, from the left to the right and from the right to the left.

palindrome

Big Giveaway  $k = 3 \frac{n^2}{=}$

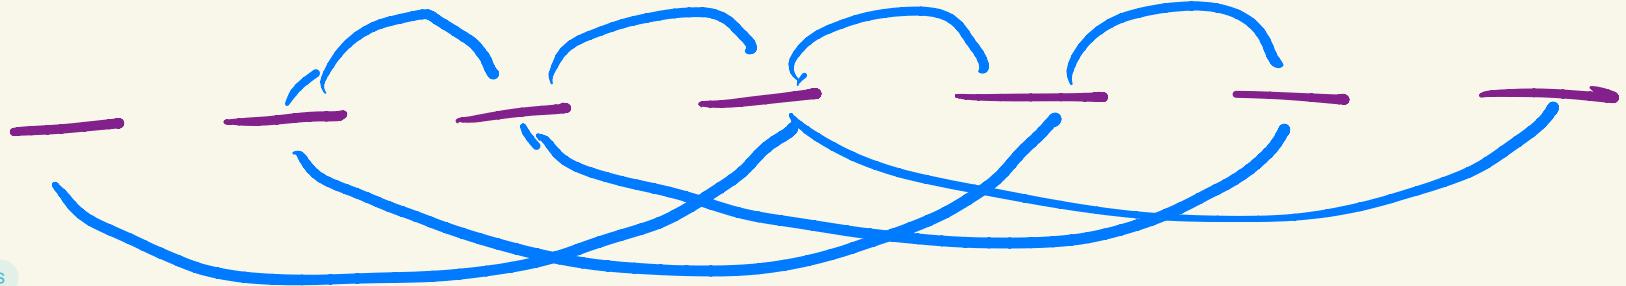

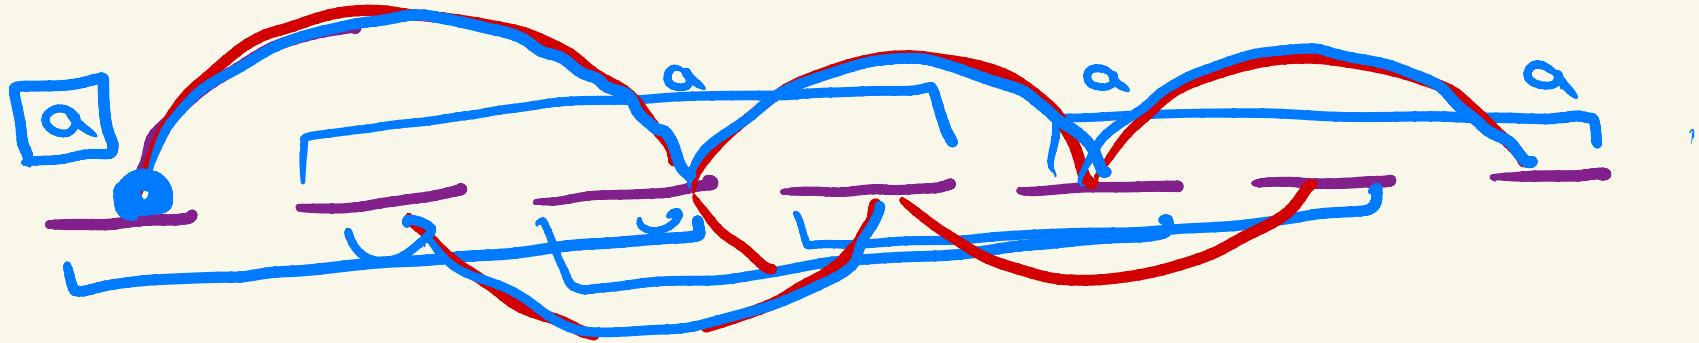

$n, m, k \leq 2000$

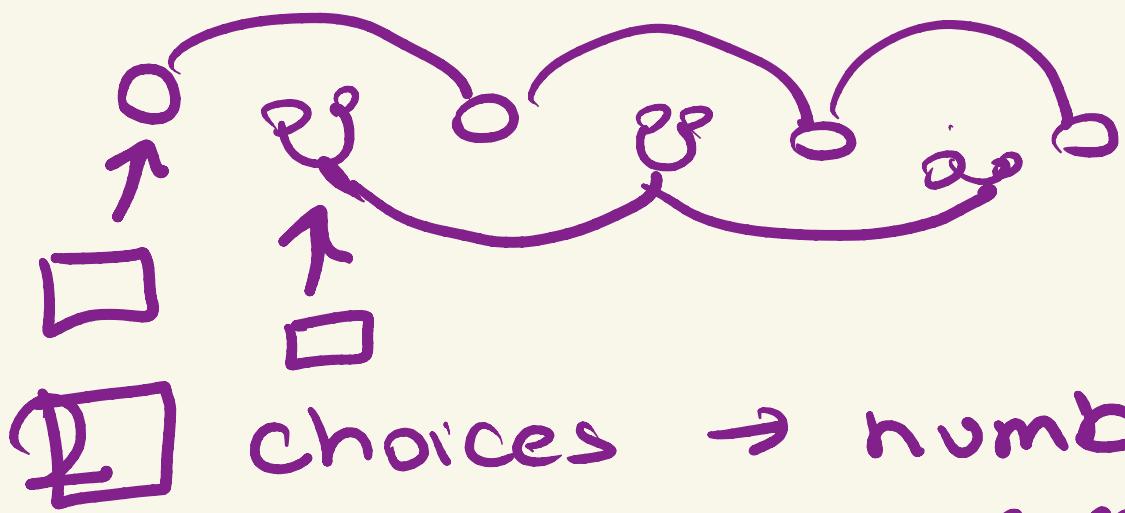

alphabet  $\rightarrow 26$   
 $\hookrightarrow m$  character

How many such strings exist??

$K = 3$

$[1-m]$        $[1-m]$

↓                  ↓

↑ m choices

$$m \frac{\text{no. of CC}}{ }$$

# Implementation

```
int n, m, k; cin >> n >> m >> k;  
  
UnionFind DSU(n);  
  
for(int i = 0; i <= n - k; i++) {  
    int left = i, right = i + k - 1;  
    while(left < right) {  
        DSU.unionSet(left, right);  
        left++, right--;  
    }  
}  
  
int leaders = 0;  
  
→ for(int i = 0; i < n; i++) leaders += (DSU.findSet(i) == i);  
  
cout << power(m, leaders) << "\n";
```

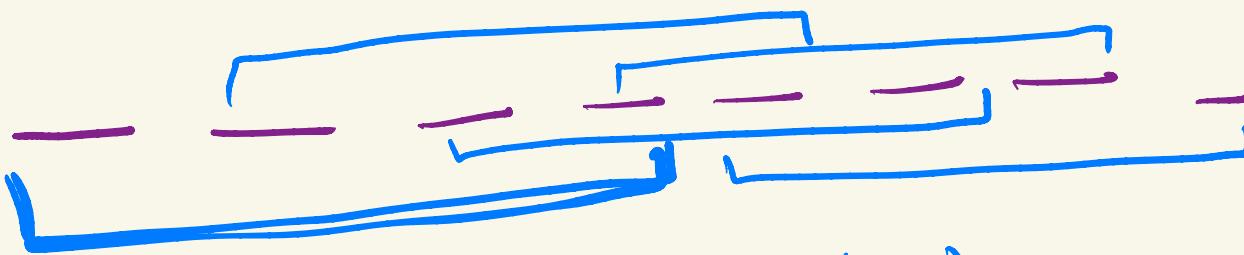

$O(n^2)$

$$\rightarrow P(i) = ?$$

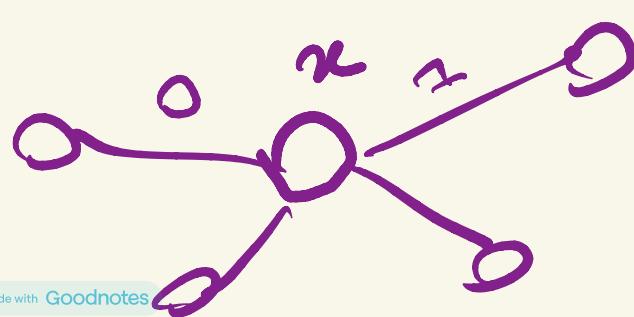

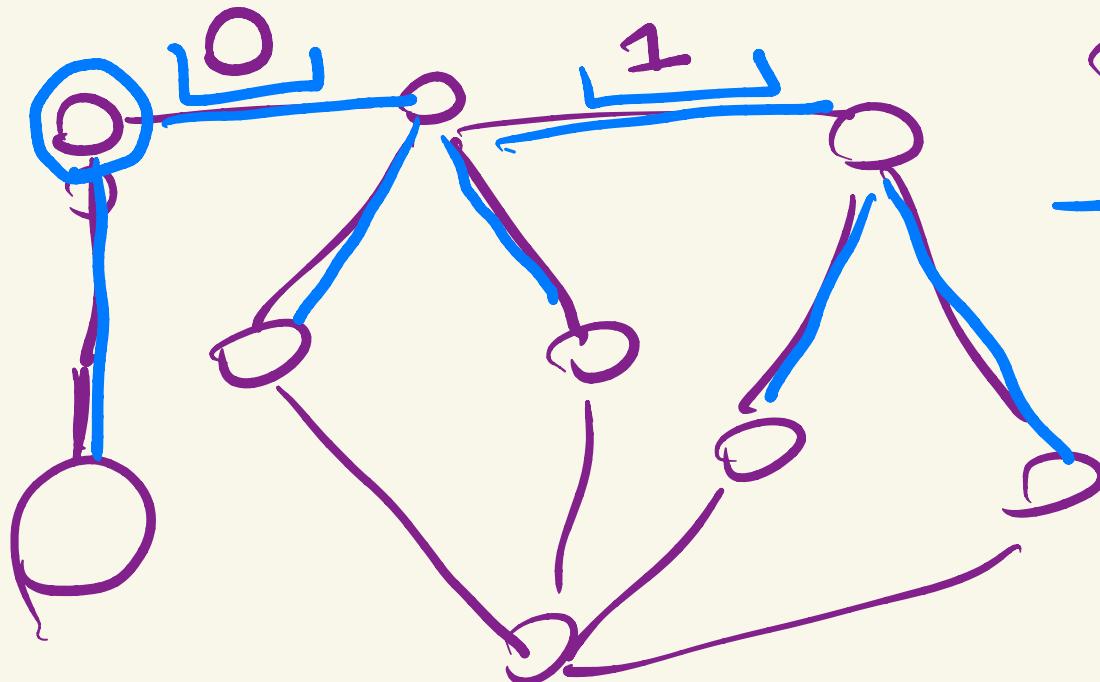

DFS

$$k = n/2$$

$n/2$  subst  $\rightarrow$   $n/2$

$$O(n \times n) \rightarrow O(n^2)$$

$x$   
 $x+1$

$\rightarrow [x, u, u, x+1, \dots]$

$x$        $x+1$

$O(n+m)$
